

Amendments to the Claims:

Please amend Claims 1, 3, and 4, and add new Claims 6 through 9, as follows.

1. **(Currently Amended)** An image forming apparatus for forming an image on a recording material, comprising:

an image bearing member;

first developing means for developing a latent image formed on said image bearing member;

second developing means for developing a latent image formed on said image bearing member;

a rotary member for holding said first and second developing means, with a first drive receiving part being provided at a first side plate at one end portion in a longitudinal direction of said rotary member, and a second drive receiving part being provided at a second side plate at the other end portion;

a rotary shaft ~~having~~ including a first drive transmitting part engaged with said first drive receiving part, and a second drive transmitting part engaged with said second drive receiving part; and

a driving source for driving said rotary ~~shaft~~, shaft,

wherein when said rotary shaft is rotated by power of said driving source, the power is transmitted to said first and second drive receiving parts and said rotary member is rotated.

2. **(Original)** The image forming apparatus according to Claim 1,
wherein said first side plate and said second side plate of said rotary member are
connected by only one connecting member at a center.

3. **(Currently Amended)** The image forming apparatus according to Claim 1,
wherein said rotary member ~~[[has]]~~ includes a connecting member with a square-
shaped section for connecting a center of said first side plate and a center of said second
side plate.

4. **(Currently Amended)** The image forming apparatus according to Claim 3,
wherein ~~the section of~~ said connecting member ~~[[is in]]~~ has a ~~shape of “コ”~~ shaped
cross section.

5. **(Original)** The image forming apparatus according to Claim 1,
wherein said first and second drive receiving parts are gears, and modules and
numbers of teeth of both gears are the same.

6. **(New)** A color image forming apparatus for forming an image on a transferring
member, comprising:

a driving source;

an image carrying member to which an electrostatic latent image is formed; and

a rotary holder capable of holding each of a plurality of developing means for developing said electrostatic latent image and of rotating to face each of said plurality of developing means to said image carrying member,

said rotary holder including:

a pair of discs for holding said plurality of developing means;

a pair of first gears each provided to each of said pair of discs, for transmitting a driving force from said driving source to said discs to rotate said discs;

a pair of second gears each engaged with each of said pair of first gears to transmit a driving force from said driving source to each of said pair of first gears, said pair of second gears being connected with each other by said first connecting member to be rotated integrally with each other; and

a second connecting member for connecting each of rotation center portions of said pair of discs to fix a space between said pair of discs, said second connecting member having a “コ” shaped cross section and being a metal sheet so that said second connecting member is capable of being twisted by a predetermined amount.

7. (New) The color image forming apparatus according to Claim 6,

wherein said pair of first gears include the same numbers of teeth as a module, and said pair of second gears include the same numbers of teeth as a module.

8. (New) The color image forming apparatus according to Claim 6,
wherein said first connecting member is made of a metal bar member.

9. (New) The color image forming apparatus according to Claim 7,
wherein said pair of second gears are connected with each other by said first
connecting member in a state in which said pair of second gears are in phase with each
other.
